PRACTICE TEST 1 (100 QUESTIONS | 100 MARKS | 60 MINUTES)

SECTION I: ENGLISH LANGUAGE (Q1 – Q30)

Directions (Q1–Q8): Read the passage below and answer the questions that follow.

The global transition toward renewable energy architectures has fundamentally disrupted legacy centralized power grids. While solar and wind generation eliminate direct carbon externalities, their inherent intermittency introduces massive frequency stability challenges for transmission system operators. Energy storage systems, particularly lithium-ion battery arrays and pumped-hydro installations, have emerged as indispensable buffers to smooth intraday demand-supply imbalances. Furthermore, the integration of advanced smart meters and decentralized IoT sensors enables dynamic pricing models that incentivize consumer demand response. However, critical mineral supply chain bottlenecks—specifically regarding lithium, cobalt, and rare earth elements—threaten to throttle the pace of green infrastructure deployment. Consequently, geopolitical diversification and investments in alternative solid-state chemistries have become paramount for national energy security.

Q1. What primary challenge does the intermittency of solar and wind generation introduce to power grids?
